Generative AI Homework #1 | Parsa Rezaei

351 words

For this homework, I used generative AI as a partner while building and publishing my portfolio. I began with ChatGPT because it was a useful place to generate ideas and think through the purpose, audience, content, and structure of the site. We shaped it into a professor-focused portfolio that could communicate my background, interests, and current projects quickly. ChatGPT also helped me settle on a restrained visual direction: a dark academic foundation, strong typography, one accent color, and subtle technical visuals.

The first website version gave me a useful starting point. Codex then worked in my actual project folder, inspected the files, and implemented refinements directly. That agentic way of working is the part of AI I particularly like and would like to master. It made the process feel more practical than receiving code or suggestions alone, because I could review the changes in the files and see the site in a browser.

The process also showed me where AI can fall short. The website looked complete, but an audit against the homework checklist found missing items. At first, the Chinese name and student ID were not on the page, and I had not prepared the required AI Interaction Log or reflection PDF. AI did not highlight every input and deliverable I needed early enough. I had to inspect the result myself, compare it with the assignment, and provide the confirmed personal information and clearer follow-up instructions. I also noticed that a correct-looking page does not prove that every requirement has been met.

I decided to keep the original design and simple HTML/CSS structure rather than redesigning the site. I added only the confirmed name and student ID, then prepared the documentation from the real workflow and reflections. I did not need JavaScript for this portfolio. The experience taught me to treat AI output as a draft that needs review, not as a finished submission. My process became: specify, generate or act, inspect, find gaps, provide better information, and iterate. AI can take substantial responsibility for implementation, but I remain responsible for the goals, factual accuracy, completeness, and final decisions.
